

THE FIFTH ELEMENT

COMPOSABLE AI HACKATHON 2026

Track T5 · Behavioural signal and intervention agents

LEELOO

An autonomous cart recovery agent that decides one shopper at a time, acts on her own, and explains every call it makes.

WHY THIS MATTERS

Not every abandoned cart needs a fixed discount.

Most recovery programmes send one offer to everyone who leaves.

70.2%

of online shopping carts worldwide are abandoned before checkout

Baymard Institute, 2026 — average of 50 documented studies

TODAY

One response for every shopper

A cart goes quiet and the same coupon goes out. But some shoppers come back on their own within hours, some need a reason to finish, and some are gone whatever you send. One blanket discount pays margin to the first group and teaches the second to wait for the next code.

FUTURE STATE

One decision per shopper

Leeloo reads the whole picture — the basket, what they have bought before, how their past abandonments ended, where they stand in the brand's loyalty programme — then chooses from a set of actions she uses to encourage conversion. No thresholds or hard rules are written down anywhere.

THE RESULT

Spend where it changes the outcome

The shopper who was always coming back is left alone, and keeps his full price. The one who needed a reason gets it in minutes rather than days. Every decision arrives with the reasoning behind it, a person marks it good or bad, and the next decision starts from that.

Two shoppers leave the same basket and get two different answers, out of the same code path and with no rule written to separate them.

Meet Leeloo: One agent, five platforms = more conversions

A cart counts as abandoned when it has an email address, at least one item, and has been quiet for ten minutes. Eligibility and consent are resolved before Leeloo reasons, so an ineligible reward is never offered to her.

From an abandoned cart to personalized incentives to convert

1 A cart goes quiet

SHOPIFY

A shopper fills a basket and stops. A custom Shopify app writes every cart change into Databricks as it happens, so the table always holds the current state of every basket in the shop — live, converted, or gone quiet.

2 The sweep finds it

DATABRICKS

A dynamic **Databricks View** does the hard part once: it keeps a live shortlist of recoverable carts — email address present, at least one item, quiet for ten minutes. Leeloo just reads the view every five minutes instead of interrogating the entire warehouse.

3 She reads the customer

DATABRICKS

For each stale cart she reads the seven groups she is allowed to consider: the cart itself, commerce history, past abandonments and how many resolved unaided, loyalty standing, governance state, and how comparable customers behaved.

4 She asks what she may give

ANTAVO

The reward catalogue comes back already filtered. Tier gating, stock and claim limits are resolved at query time, so an ineligible reward is never an option she has to be trusted to refuse.

5 She decides

GEMINI

All of it goes to gemini-3.8-flash in one shot. No thresholds are supplied and no action is mapped to a condition. Back comes one choice — a reward, bonus loyalty points, a message, double points, or a hand-off to a person for escalation — and the reasoning behind it.

6 She acts

ANTAVO

The choice travels as one custom event, **ai_action**, and Antavo's workflows carry it out. A reward is claimed through the API, so one priced in points genuinely costs the member points, and a live coupon code or other reward comes back.

7 The customer hears about it

BLOOMREACH

Antavo triggers Bloomreach directly, so the live code or reward information is in the message rather than waiting on a sync. The template builds itself around **incentive_type**, so a coupon, a points grant and a tier nudge each read differently.

8 The loop closes

SLACK → DATABRICKS

Leeloo posts what she did, why, and what Antavo returned. A human answers good call or bad call, that verdict is logged beside the decision, and the next run reads it. The cart's own outcome from Shopify lands back in the same table.

Take away any one of the five platforms and the loop stops: nothing fires, or there is no context, no decision, no lever to pull, or nobody is told. Every run ends by writing back what happened, so the next decision starts from a better place than the last one did.
